- RENTME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

- MISCELLANBOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
- IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

- I- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. PLASMINOGEN SUBFAMILY.
- I- SIMILARITY: Contains at least 2 kringle domains.

The human apolipoprotein(a) kringle domains IV36 (LK6 protein), IV37 (LK7 protein) and V38 (LK8 protein) together form the angiogenesis inhibitor, LK68 protein. LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo chorioallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic disease in animals or humans. LK68 is useful as an anticancer agent ar also for inhibiting primary tumour growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel angiogenesis inhibitor, LK68 for treating angiogenesis-mediated diseases, e.g. cancer and rheumatoid arthritis, has human apollpoprotein(a) kringle domains IV36, IV37 and V38 amino acid sequence

LK68 protein contains the amino acid sequences of human apolipoprotein(a) kringle domains IV36 (LK6 protein), IV37 (LK7 protein) and V38 (LK8 protein). LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo choricallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic disease in animals or humans. LK68 is useful as an anticancer agent and also for inhibiting primary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC The invention relates to a method of preparing plasminogen kringle 5
CC peptide fragments. The method comprises mixing mammalian plasminogen and
CC elastase in the ratio 1:100-1:300, followed by incubating and isolating
CC the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
CC endothelial cell proliferation and migration. The peptides are useful
CC for treating angiogenic diseases, primary and metastatic solid tumours
CC arcinomas of various organs such as breast, genital tract,
CC endocrine glands, skin, tumours of the brain and eyes and solid tumours
CC arising from haematopoietic malignancies such as leukaemias and
CC (arghomas. They are also used for the prophylaxis of various autoimmune
CC diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases
CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber
CC (arghomas in the caused by excessive or abnormal stimulation of
CC endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases
CC which have angiogenesis as a pathologic consequence (e.g., cat scratch
CC disease and ulcers). The peptides are also useful as a birth control
CC agent which inhibits ovulation and establishment of the placenta.
CC sequences AAB01906-B01919 represent fragments of human plasminogen used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc peptide fragments. The method comprises mixing mammalian plasminogen and calastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and cendothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours candocraine glands, skin, tumours of the brain and eyes and solid tumours carising from haematopoietic malignancies such as leukaemias and carcinomas. They are also used for the prophylaxis of various autoimmune clisaceses (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC Syndrome), diseases caused by excessive or abnormal stimulation of cendothelial cells (e.g., Crohn's disease, atherosclerosis), diseases CC which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation destablishment of the placenta.

CC sequences Abs01906-80191 represent fragments of human plasminogen used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and clastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoletic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoinmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber Syndrome), diseases caused by excessive or abnormal stimulation of disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta.

The method comprises mixing mammalian plasminogen and CC elastase in the ratio 1:100-1:300, followed by incubating and isolating CC the fragment. The kringle 5 peptides are inhibitors of anglogenesis and CC endothelial cell proliferation and migration. The peptides are useful CC for treating anglogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, CC endocrine glands, skin, tumours of the brain and eyes and solid tumours CC endocrine glands, skin, tumours of the brain and eyes and solid tumours CC endocrine glands, skin, tumours of the brain and eyes and solid tumours CC lymphomas. They are also used for the prophylaxis of various autoimmune CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC (e.g., psoriasis), blood vessel diseases, atherosclerosis), diseases (e.g. have anglogenesis as a pathologic consequence (e.g., cat scratch CC disease and ulcers). The peptides are also useful as a birth control CC agent which inhibits ovulation and establishment of the placenta. CC sequences AAB01906-B0191 represent fragments of human plasminogen used CC in an exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                is derived from the plasminogen protien, and comprises amino acids 99-467. Greenstatin is also derived from plasminogen, and comprises amino acids 101-354. Angiostatin and greenstatin are used as thrombolytic factors and angiogenesis inhibitory proteins. Angiostatin contains the kringle 1-4 region of plasminogen, and greenstatin contains the kringle 1-3 region of plasminogen, and greenstatin contains the kringle 1-4 region of plasminogen, and greenstatin contains the kringle 1-3 region of plasminogen, and greenstatin contains a high specification describes a method for the purification of such angiogenesis inhibitory proteins. The method comprises solubilising the proteins, produced as inclusion bodies in Escherichia coli and glutathione. The angiogenesis inhibitory proteins specifically inhibit proliferation of vascular endothelial cells, but not that of non-endothelial cancers or normal cells. The angiogenesis inhibitory

                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a preferred angiogenesis inhibitor of the invention that is obtained by cleavage of human plasminogen with spitting cobra (Naja nigricollis nigricollis) venom K4 protease and plasmin. The K4 protease cleaves native plasminogen following amino acid residue 452, with little or no disruption of the first 4 plasminogen kringles. Plasmin cleaves between residues 77 and 78 of human plasminogen. Thus, the present protein spans amino acid residues 78-451 of plasminogen. The angiogenesis inhibitors obtained from plasminogen can be used to inhibit tumour growth in a mammal preferably human. They are useful for treating angiogenesis associated diseases such as: solid tumours, prosetate cancer, breast cancer, colon cancer and lung cancer (claimed);
                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                              blood-borne tumors such as leukaemia; metastasis; benign tumours; rheumatoid arthritis; psoriasis; ocular angiogenic diseases; myocardial angiogenesis; plaque neovascularization; telangiectasia; haemophiliac joints; angiofibroma; wound granulation; excessive or abnormal stimulation of endothelial cells; and as birth control

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a preferred angiogenesis inhibitor of the invention that is obtained by cleavage of human plasminogen (Naja nigricollis) reproduced of human plasminogen (Naja nigricollis) venom K4 protease cleaves of human plasminogen (CC protease and plasmin. The K4 protease cleaves native plasminogen (CC the first 4 plasminogen kringles. Plasmin cleaves between residues (CC the first 4 plasminogen kringles. Plasmin cleaves between residues (CC the first 4 plasminogen kringles. Plasmin cleaves between residues (CC the first 4 plasminogen. Thus, the present protein spans (CC the first 4 plasminogen. Thus, the present protein spans (CC the first 4 plasminogen. Thus, the present protein spans (CC the first 4 plasminogen can be used to inhibit tumour (CC the first 4 plasminogen can be useful for treating (CC the first 4 plasminogen can be useful for treating (CC the first 4 plasminogen can be useful for treating (CC the first 4 plasminogen can be useful for treating (CC the first 4 plasminogen can be useful for treating (CC cancer, breast cancer, colon cancer and lung cancer (claimed); (CC the first 5 plasminogen cancer (claimed); (CC the first 5 plasminogen cancer and lung cancer (claimed); (CC myocardial angiogenesis; plaque neovascularization; telangiectasia; (CC the first 5 plasminogen collar angiogenic diseases; (CC aspants by preventing vascularization required for embryo (CC aspants by preventing vascularization required for embryo (cc the first 5 plasminogen cancer and the stabilize any residual primary (cc the first 5 plasminogen cancer and the stabilize any residual primary (cc the first 6 plasminogen cancer (claimed); (cc the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of angiostatin fragments or aggregates - for inhibiting endothelial cell proliferation and treating angiogenesis-mediated diseases, e.g. cancer, arthritis or diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, aggregate angiostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              08-MAR-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                               CC similar to that of a plasminogen fragment (see murine plasminogen)

CC AAB16490). Angiostatin has the ability to inhibit angiogenesis.

CC Endostatin is also an angiogenesis inhibiting protein (see AAB16451 and CC AAA68203). Sequences AAA68242 and AAB16522 represent coding and protein,

CC and some of the peptides AAA68242 and AAB16522 represent coding protein,

CC and some of the peptides of the invention share homology with regions of

CC laminin. Peptides AAB16452-B16521 (excluding AAB16490) are the

CC angiogenesis-inhibiting protein receptor fragments of the invention. The

CC angiogenesis-inhibiting protein receptor fragments of the invention. The

CC peptides bind either angiostatin or endostatin and can be used in methods

CC gettides bind either angiostatin or endostatin and can be used in methods

CC cohn as solid tumours, psoriasis, scleroderma, myocardial angiogenesis,

CC Crohn's disease, cerebral collaterals, arteriovenous malformations,

CC crobsis, diabetic retinopathy, arthritis, wound healing, peptic ulcers,

CC Helicobacter related diseases, fractures, placentation and cat scratch

CC fever. They are useful for the detection and prognosis of cancer. DNA

                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the DNA sequences encoding them. Angiogenesis is the generation of numblood vessels into a tissue, and normally occurs in wound healing, foetal and embryonal development and the formation of the corpus luteriod endometrium and placenta. Angiostatin is a protein (see AAB16450 and AAA66202) involved in angiogenesis, and has an amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New angiogenesis-inhibiting protein receptors, useful in methods for treating diseases and processes that are mediated by angiogenesis, su as solid tumours, psoriasis, scleroderma and myocardial angiogenesis

                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to methods of regulating angiogenesis in individual by administering an angiogenesis regulating composition comprising a tropomyosin binding compound or an actin disrupting compound. The compositions are useful for treating diseases and process mediated by angiogenesis including haemangioma, solid tumours, blood bourne tumours, leukaemia, metastasis, Crohn's disease, "coronary or cerebral collaterals, arthritis, diabetic neovascularisation, macular degeneration, wound healing, Helicobacter related diseases, ovulation, menstruation, and cat scratch fever. The present sequence is a protein described in the exemplification of the invention.

                                                                  amino acids 355-791 of human plasminogen. Also claimed are a method for the preparation of angiostatin, and angiostatin prepared by this method. The human plasminogen protein fragment is prepared by: (a) applying human plasminogen to a lysine Sepharose column to separate it into plasminogen form 1 and form 2; (b) separating plasminogen form 1 and form 2 and digesting them with elastase; (c) fractionating the elastase-decomposed product of form 1 plasminogen and form 2 plasminogen in a lysine sepharose column; (d) collecting the fractions bound to the lysine sepharose column; (e) further fractionating the form 2 plasminogen using an Aminohexal Sepharose column; and (f) collecting the fraction bound to the Aminohexal Sepharose column; This human plasminogen fragment can be used to inhibit growth of vascular endothelial cells. The present sequence represents amino acids 355-791 of human plasminogen.
                                                                                                                                                                                                                                                                                      Human plasminogen derived polypeptide - has neovascularisation inhibiting activity
                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disulfide-bond

RESULT 15
AAY79224
     mammal, preferably human. They are useful for treating angiogenesis-associated diseases such as: solid tumours, prostate cancer, obreast cancer, colon cancer and lung cancer (claimed); blood-borne tumors such as leukaemia; metastasis; benign tumours; blood-arthritis; psoriasis; ocular angiogenic diseases; myocardial angiogenesis; plaque neovascularization; telangiectasia; haemophiliac joints; angiofibroma; wound granulation; excessive or abnormal stimulation of endothelial cells; and as birth control
                                                                                                             The present sequence represents an angiogenesis inhibitor obtained by cleavage of human plasminogen with snake venom K4 protease from spitting cobra (Naja nigricollis nigricollis). The K4 protease cleaves the plasminogen following amino acid residue 452, producing an angiogenesis inhibitor with little or no disruption of the first 4 plasminogen kringles. Further, preferred angiogenesis inhibitors of the invention are obtained by plasmin cleavage of this K4 protease-cleaved plasminogen fragment (see ANY79225 and ANY79226). angiogenesis inhibitors are used for inhibiting tumour growth in a mammal, preferrably human. They are useful for treating
                                                                                                                                                                                                                                                                                                  Claim 14; Fig 8; 72pp; English.
                                                                                                                                                                                                                                                                                                                             New angiogenesis inhibitors useful for treating solid tumors, leukemias, tumor metastasis, benign tumor, rheumatoid arthritis, psoriasis and ocular angiogenic diseases
                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2000-246485/21.
